Morgellons and Lyme Graded (Single Scan) introduction

The Morgellons and Lyme Graded protocol improves the effectiveness of the existing Morgellons and Lyme protocol by grading frequency sets via biofeedback. By grading each part of the Morgellons and Lyme protocol, the most important frequencies of each section are run, thereby reducing the number of frequencies run and eliminating the frequencies that may not apply to your particular condition. This means the important frequencies specific to you get more run time as compared with running all the Morgellons and Lyme frequencies.

The grading of each part of the Morgellons and Lyme protocol is not done via using a grading preset, but rather by using a full system scan and evaluating a set of frequencies from a grading preset against the results of the full system scan to determine the effectiveness of a particular frequency in the protocol section.

Before you start this protocol, you must run the Terrain protocol documented in the Presets tab of Spooky in *\Detox\GUIDE Terrain Protocol - Click Me.pdf*. I recommend using the Contact, Plasma, Scalar, Laser, or Coil presets in addition to the Remote presets for the Terrain protocol to increase the effectiveness of the protocol.

The Morgellons and Lyme Graded protocol is broken into 9 sections, starting from the smallest organisms to the largest. These sections are called Viruses, Biofilm, Co-infection, Other Bacteria, Fungus and Mold, Simple Parasites, Complex Parasites, Body Sites and Biotech, and Infrastructure.

Every few days you create using the provided utility a set of presets using a full system scan plus you specify your current section of the protocol.

Overview of the protocol

The full system biofeedback scan the main focus of this protocol. You perform a system scan every 2-3 days, using *\Biofeedback\GeneratorX\GX General Biofeedback Scan (C) - JW* for Generator X, and *\Biofeedback\Spooky Pulse\General\ALL Biofeedback Scan - DB* for Spooky Pulse. After you finish the scan, there is no need to save your frequencies into the custom database *BFB_Frequencies.csv*, as the utility uses the raw scan data files. For Generator X, a system scan takes about 4 minutes and for Spooky Pulse a system scan takes about 5-6 minutes.

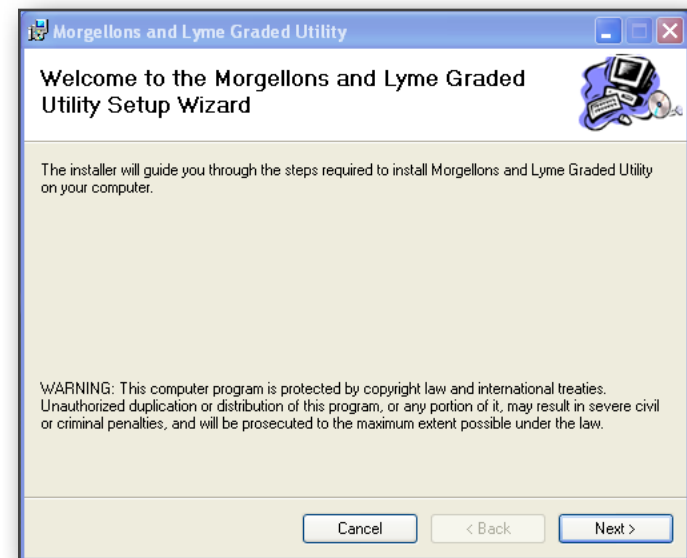

For the section of the protocol you are currently in, you create presets using the **Morgellons and Lyme Graded Utility**, specifying the raw scan data file and the section of the protocol you are in. These presets are saved in `\User\Morgellons and Lyme Graded\`. Ideally these presets are run on 3 generators; Generator 1 and Generator 2 run Remote presets, while Generator 3 runs the Plasma/Contact/Scalar/Laser/Coil presets. If you only have 2 generators, you can timeshare Generator 2 between the Remote preset for Generator 2 and the Plasma/Contact/Scalar/Laser/Coil preset for Generator 3. The Remote and Contact presets require you use Spooky Boost on your generators. You must not use Spooky Boost for the Plasma, Scalar, and Laser presets.

Installing Morgellons and Lyme Graded utility

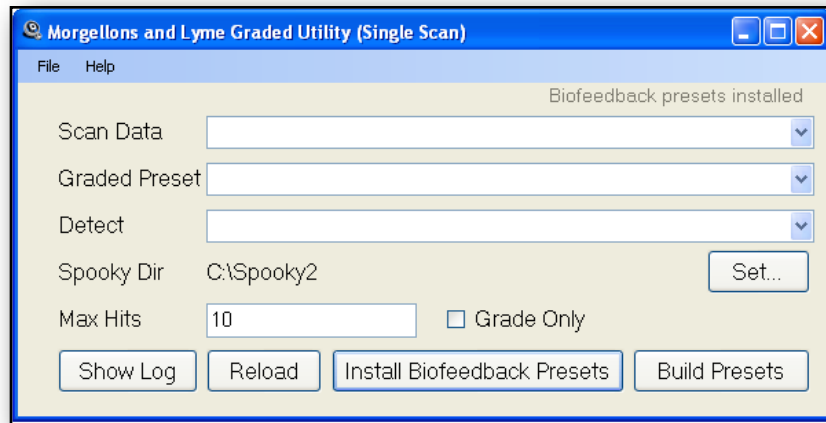

The Morgellons and Lyme Graded Utility comes in a zip archive, an example name of the archive is Morgellons and Lyme Graded Utility.msi.zip. After downloading the zip file, extract the context of the zip archive, in this case a file called Morgellons and Lyme Graded Utility.msi. Double-click this file in the Windows Explorer/File manager, and you get the window to the right.

Click the Next > button, and on each successive screen, click Next > again, until the window says “Installation Complete”. Then click the Close button.

On your background screen is an application icon called Morgellons and Lyme Graded Utility.

Installing the biofeedback presets

Once you've installed the application, run it. If the Spooky Dir is not the same as your Spooky directory, use the Set... button to specify your Spooky directory. Click the "Install Biofeedback Button" to install the biofeedback presets. After the installation finishes, you will see a status message in the top right part of the window. In the picture below, the status says "Biofeedback presets installed."

Taking your first scans

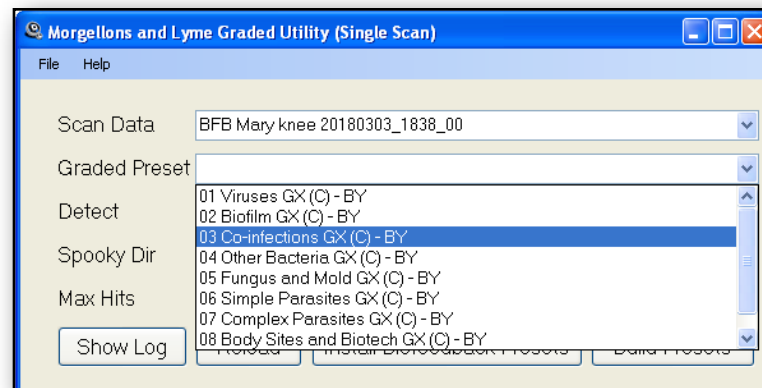

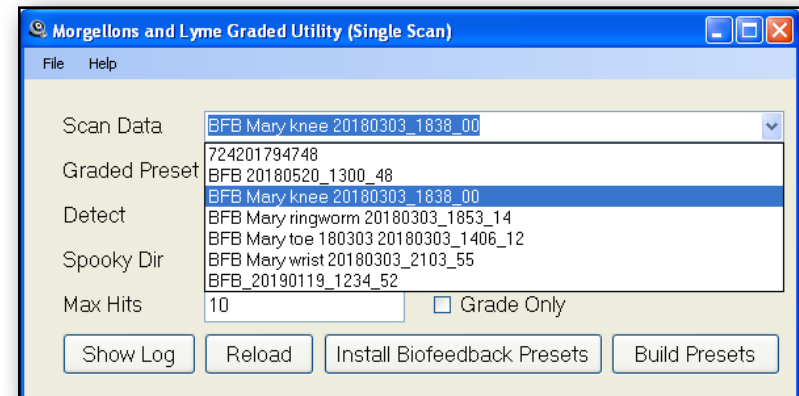

You perform system scan every 2-3 days, using *\Biofeedback\GeneratorX\GX General Biofeedback Scan (C) - JW* for Generator X, and *\Biofeedback\Spooky Pulse\General\ALL Biofeedback Scan - DB* for Spooky Pulse. If you have Spooky Scalar and the Scalar Digitizer, you can use the biofeedback preset under *\Biofeedback\Scalar Digitizer*. If you are currently running any Remote presets on other generators, you want to Pause the programs, and unpause them (click Pause again) when you are finished with the scan.

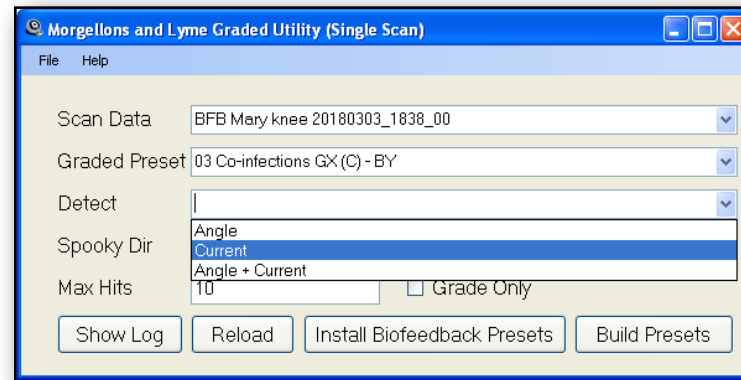

Once you've finished and saved the first system scan, it's time to build your first presets.

Building your presets

After you've finished your system scan in Spooky, bring up the **Morgellons and Lyme Graded Utility**. Click on the down arrow on the combo box next to the Scan Data label, a menu will appear that has a list of the choices of biofeedback scan data files to choose (see the image to the right). Choose the newest system scan data file. If you don't see your recent scans in the menu, click the Reload button to load the current contents of the database into the utility.

Click the down arrow on the combo box next to the Graded Preset label, and a list of protocol steps appear. Start with the first entry/step, *01 Viruses GX (C) - BY* for your first preset.

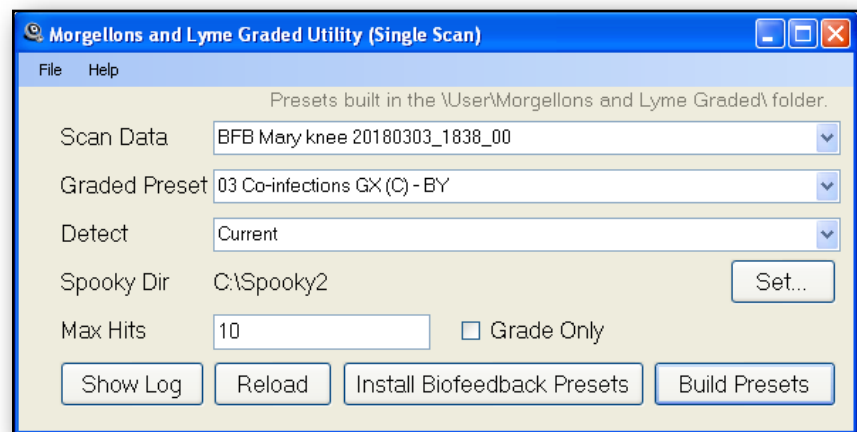

Next you set the Detect field. For Spooky Pulse scans, the values of Detect are BPM (beats per minute) or HRV (heart rate variability). For Generator X, the values of Detect are Angle (phase angle), Current, and Angle+Current. If you are not sure of what to choose, choose HRV or Current.

The Max Hits field is the number of the top frequencies to use. The default value is 10 hits. The minimum run time for the Remote, Contact, and Coil presets will be the Max Hits value times 3 minutes, or in the default case, 30 minutes. For the Plasma, Scalar, and Laser presets, the minimum runtime is the Max Hits value times 6 minutes, or in the case of the default value of 10 hits, 60 minutes. For the Contact, Plasma, Scalar, Laser, and Coil presets, run them twice daily for at least 1 hour, but ideally 2 or more hours.

Once all fields are set, click the “Build Preset” button to build your presets.

If the “Build Preset” operation is successful, you see a status message in the top right part of the window that says “Presets built in the \User\Morgellons and Lyme Graded\ folder.”

Running your presets

Now that you've built your first presets, you can now run them on your generators. These presets are found in *\User\Morgellons and Lyme Graded*. If you have 3 generators, you run the following:

Generator 1	Generator 2	Generator 3
Morgellons and Lyme Graded Gen1 (R) - BY	Morgellons and Lyme Graded Gen2 (R) - BY	Morgellons and Lyme Graded Gen3 (C) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (P) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (S) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (L) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (Coil) - BY

If you only have 2 generators, you shared Generator 2 between the Remote preset and your Plasma/Contact/Scalar/Laser/Coil preset.

Generator 1	Generator 2
Morgellons and Lyme Graded Gen1 (R) - BY	Morgellons and Lyme Graded Gen2 (R) - BY <i>and</i> (Morgellons and Lyme Graded Gen3 (C) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (P) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (S) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (L) - BY <i>or</i> Morgellons and Lyme Graded Gen3 (Coil) - BY)

You never need to change the Remote preset on Generator 1. The preset *Morgellons and Lyme Graded Gen1 (R) - BY* runs continuous detox and maintenance programs (*ALL Maintenance - DB* and *Detox Maintenance - JK*) on Out 1, and on Out 2 are the *R12 Immune System - DB*, *RX Healing A - DB*, *RX Herxheimer - DB*, *RX Healing B - DB*, *RX Healing C - DB*, and *RX Brain Fog - DB* from the Morgellons protocol.

If you have a 3 generator system, the Remote program on Generator 2 needs to be stopped and reloaded every time you rebuild your presets using the **Morgellons and Lyme Graded Utility**. If you have a 2 generator system, the next time you loaded up Generator 2 with the Remote preset, you will get the new version.

The Remote, Contact and Coil presets require the use of Spooky Boost, as there are different frequencies being sent to Out 1 and Out 2. For Plasma, Scalar, and Laser preset, DO NOT use Spooky Boost.

For Contact, Plasma, Scalar, Laser, or Coil treatments, I recommend running these treatments ideally twice a day, at 2 hours per session. If this is too much time for your schedule, you can run either one 2-hour session or two 1-hour sessions. Remember that with a 2 generator system, after you finish your Contact/Plasma/Scalar/Laser/Coil session, to connect the Remote to Generator 2 and load the Remote preset *Morgellons and Lyme Graded Gen2 (R) - BY*.

Schedule

The following table gives the run time in days of each section. The first column is the name of the section, the 2nd column is the Generator X biofeedback preset names, the 3rd column are the suggested run times in the original Morgellons and Lyme protocol, and the 4th column are the suggested run times in the Morgellons and Lyme Graded protocol. The lower number of the run times is for Plasma mode, the higher number is for contact.

Section	GeneratorX Preset	Orig. M&L run times(days)	Graded M&L run times (days)
Viruses	01 Viruses GX (C) - BY	12-18	6-12
Biofilm	02 Biofilm GX (C) - BY	16-24	8-16
Co-infections	03 Co-infections GX (C) - BY	16-24	8-16
Other Bacteria	04 Other Bacteria GX (C) - BY	8-12	4-8
Fungus and Mold	05 Fungus and Mold GX (C) - BY	8-12	4-8
Simple Parasites	06 Simple Parasites GX (C) - BY	10-15	5-10
Complex Parasites	07 Complex Parasites GX (C) - BY	16-24	8-16
Body Sites and Biotech	08 Body Sites and Biotech GX (C) - BY	10-15	5-10
Infrastructure	09 Infrastructure GX (C) - BY	50-75	25-50

Note: Remember to perform the biofeedback system scans every 2-3 days Generator X. Every time you perform a new biofeedback scan, you need to create presets using the **Morgellons and Lyme Graded Utility**, and reload Generator 2 with the Remote preset *Morgellons and Lyme Graded Gen2 (R) - BY*.

How long to run each section?

The previous chart shows the recommended times for each section in the original Morgellons and Lyme protocol, and a suggested time for the Morgellons and Lyme Graded protocol. However, you may find you need to spend either less or more time on each section, depending on how you feel and what your intuition may be saying.

If you've been doing a particular section for a few days, and perhaps have even done a few graded scans already for your current section, and you are not feeling any detox symptom or herxing, you may opt to move onto the next section. If you are adept at muscle testing or dowsing, you can test whether or not is time for you to move on to the next section. On the other hand, if you continue to experience significant detox or herxing symptoms, even

though you've met the suggested run times, you may want to continue with the current section until your detox symptoms subside. Having symptoms is a sign that you are hitting the right frequencies and you ought to continue.

How many times to run the protocol?

If you've run through the entire protocol and you still are not feeling excellent, you are welcome to repeat the protocol over again. As you are killing larger and larger organism in the body, the smaller organisms may have a chance to re-establish themselves, so running the protocol again can keep you in good shape. If on the other hand you are feeling OK, but still want assurance to keep the dormant critters dormant, I recommend running the *\Morgellons and Lyme\Morgellons and Lyme v3.0\Morgellons _Lyme Support\Plasma1 Support Gen1 (R) - BY* preset running on a single generator. This will loop through the entire original Morgellons and Lyme protocol, while simultaneously running the maintenance and healing presets. If you have 2 free generators, consider running the *Plasma2 Support Gen1 (R) - BY* preset in conjunction with the *Plasma2 Support Gen2 (R) - BY* preset.

Concerned about killing larger organism too soon?

Because you are running a full system scan frequencies from day one, there is the possibility you may start to kill the larger organisms before you've fully dealt with the smaller organisms. If you are concerned about this, you could defer running the System scan frequencies until you've completed a full cycle of the graded M&L protocol without the system scan frequencies. When you create your presets, simply check the "Grade Only" checkbox before you click "Build Presets".

I don't want to run Morgellons now. Can I use the utility?

You can use **Morgellons and Lyme Graded Utility** for applications other than the Morgellons and Lyme Graded protocol. You can add your own presets into the *\User\Biofeedback\Morgellons and Lyme Grade* folder. The utility only supports unencrypted frequencies, but you can include simple sweeps, unencrypted Molecular Weight frequencies, and wavelength frequencies. You have the option of only running your graded frequencies (check the "Grade Only" checkbox), or the combination of your graded frequencies and the system frequencies. The results

are saved to *\User\Morgellons and Lyme Graded* in the Presets for Gen2 and Gen3. After you've created these preset, you ought to rename them and copy them to the *\User* folder, as the next time you create presets with the "Build Presets" button, you will overwrite the presets in this folder.

I've added a new scan but I don't see it

If you've done a recent system scan, but don't see your new scan data file in the combo box, click the Reload button to read in the ScanData directory again.

How can I tell when I last created the presets?

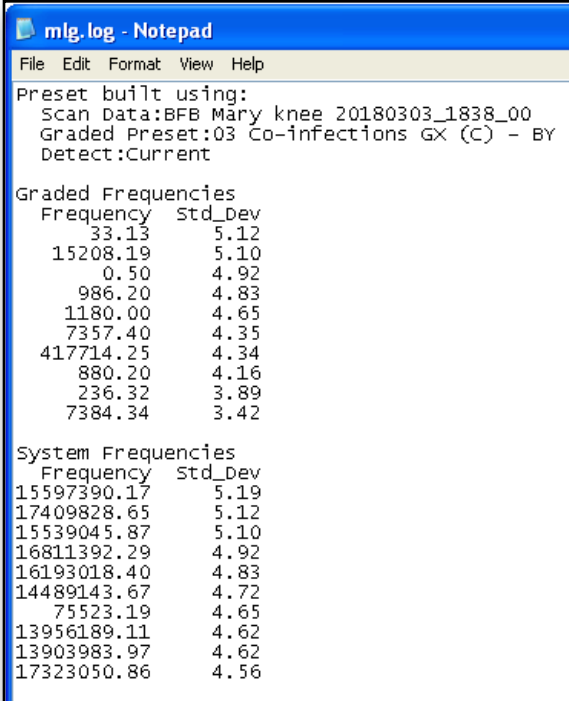

If you load the presets in *\User\Morgellons and Lyme Graded* for Gen2 or Gen3, the Preset notes will contain the create date.

How good are my graded frequencies?

Because the graded frequencies are compared against a full scan, a frequency can be compared against all frequencies found in the system scan. For each frequency in the full scan and in the graded preset, the ratio of the current to the running average of the current is calculated. Then each frequency in the graded preset can be compared against the mean ratio value in the full scan, and its number of standard deviations from the mean is calculated. At 1 standard deviation above the mean value, this puts the value in the top 16% of all values. At 2 standard deviations above the mean, this put the value in the top 2.5% of all values. At 3 standard deviation, this put the value in the top 0.15% of all values.

To see the number of standard deviation your frequencies are above the mean, click the “Show Log” button and a window will appear with these standard deviations values.

Also, when a frequency in the graded preset is evaluated, all of its harmonics and subharmonics are also compared against the system scan, and the harmonic/subharmonic/base frequency with the highest value is selected as the result.

Graded Frequencies	
Frequency	Std_Dev
33.13	5.12
15208.19	5.10
0.50	4.92
986.20	4.83
1180.00	4.65
7357.40	4.35
417714.25	4.34
880.20	4.16
236.32	3.89
7384.34	3.42

System Frequencies	
Frequency	Std_Dev
15597390.17	5.19

15539045.87	5.10
16811392.29	4.92
16193018.40	4.83
14489143.67	4.72
75523.19	4.65
13956189.11	4.62
13903983.97	4.62
17323050.86	4.56

How do I shared the protocol among two users using contact mode?

Remember this protocol takes 3 generators. The preset called *Morgellons and Lyme Graded Gen1 (R) - BY* can be shared among multiple people on the same generator. The presets called *Morgellons and Lyme Graded Gen2 (R) - BY* and *Morgellons and Lyme Graded Gen3 (C) - BY* are customized for the person who had the biofeedback scan. This will take 5 generators to treat 2 people with contact if you want to do contact treatments simultaneously, or 4 generators if you do the contact treatment at different times. So to treat 2 people, you do the following for people who are using contact treatments:

- Generator 1 - treat person 1 and person 2 using *Morgellons and Lyme Graded Gen1 (R) - BY* via Spooky Boost and Remote.
- Run a biofeedback on person 1, run the utility and do a “Build Preset”. When you do a scan on person 1, be sure to put the person’s name or initials into the “Log Name” field in the “Biofeedback Scan” area of the Control tab.
- Generator 2 - treat person 1 using *Morgellons and Lyme Graded Gen2 (R) - BY* via Spooky Boost and Remote.
- Generator 3 - treat person 1 using *Morgellons and Lyme Graded Gen3 (C) - BY* preset, via Spooky Boost and Contact.
- Run a biofeedback on person 2, run the utility and do a “Build Preset”. When you do a scan on person 2, be sure to put the person’s name or initials into the “Log Name” field in the “Biofeedback Scan” area of the Control tab.
- Generator 4 - treat person 2 using *Morgellons and Lyme Graded Gen2 (R) - BY* via Spooky Boost and Remote.
- Generator 5 - treat person 2 using *Morgellons and Lyme Graded Gen3 (C) - BY.txt* preset, via Spooky Boost and Contact.
- Note: if you do contact treatments at different times, you can reuse Generator 3 for person 1 and person 2. However, you must remember to use a preset that was created for current person getting the contact treatment. If you look in the Preset Notes, it will say which scan data file was used to create the preset.

The preset called *Morgellons and Lyme Graded Gen2 (R) - BY* cannot be shared on the same generator, because it is customized to the person whose biofeedback raw scan data was used to create the preset. Also, remember you must take biofeedback scans every 2-3 days for person 1 and person 2.

After you do a scan for person 1, you run the utility to create a new sets of presets, and load *Morgellons and Lyme Graded Gen2 (R) - BY* onto Generator 2 and load *Morgellons and Lyme Graded Gen3 (C) - BY* into Generator 3 for person 1.

After you do a scan for person 2, you run the utility to create a new sets of presets, and load *Morgellons and Lyme Graded Gen2 (R) - BY* onto Generator 4 and load *Morgellons and Lyme Graded Gen3 (C) - BY* into Generator 5 for person 2.

If you can't remember who the latest *Morgellons and Lyme Graded Gen2 (R) - BY* preset or the *Morgellons and Lyme Graded Gen3 (C) - BY* preset is for, either person 1 or person 2, look inside the Preset Notes in the Presets tab of Spooky2 for the preset and it will give you the name of the raw scan data file that was used to create that preset. If you put the person's name or initials into the "Log Name" field, this raw scan data file name contains the name or initials of the person who was treated.
